Marine Fuel & Storage Quick Guide

Octane and ethanol are separate checks. Fresh fuel still matters, even when it's ethanol-free.

MANUAL MINIMUM OCTANE

HBW MARINE GAS

During marina season, HBW sells confirmed 89 AKI ethanol-free gasoline in Gores Landing, by road or water. It must still be fresh and meet your exact engine's minimum octane.

At the pump

- ☐ Check the serial-number manual for minimum octane. Don't assume by engine family.
- ☐ Read the ethanol statement separately. Premium or 89 doesn't automatically mean ethanol-free.
- ☐ Current Mercury gasoline engines allow no more than E10. Don't use E15 or E85.
- ☐ Choose fresh ethanol-free fuel when possible, provided it meets the octane requirement.
- ☐ Keep the receipt and record the grade, ethanol label, date and location.

If the boat may sit

- ☐ Start with suitable fresh fuel. Stabilizer doesn't restore old or separated fuel.
- ☐ Treat fuel promptly and at the product's correct concentration.
- ☐ Run the engine as the Mercury storage procedure directs so treated fuel reaches the system.
- ☐ Use the boat and turn fuel over. Ethanol-free fuel still oxidizes and can collect water.
- ☐ There's no responsible universal shelf-life promise. Storage conditions and fuel history matter.

Suspect bad fuel?

- Stop repeatedly running questionable fuel through injectors or carburetors.
- Record how long it sat and everything added to the tank.
- Don't top off phase-separated or contaminated fuel and call it fixed.
- Don't diagnose fuel by smell or colour alone.
- Arrange safe sampling, diagnosis and disposal when contamination is possible.

Remember

- ☐ 87, 89, 91 and 93 are anti-knock ratings, not ethanol percentages.
- ☐ E10 can contain up to 10 percent ethanol.
- ☐ Fresh ethanol-free fuel is our preferred local choice when it meets the manual.
- ☐ Higher octane doesn't fix contamination, wrong propping, overload or a mechanical fault.
- ☐ The cowl label and manual for the exact serial number decide.
